Gas Stove

Category: **Food Processing & Kitchen** Type: **Full SOP** Priority: **High** 4 labs

Covers these lab items: Cooking Range; Cooking Range (Gas/Electric); Single Burner Stove

What it is used for

A gas stove burns a compatible fuel to provide heat for cooking or food preparation. Correct ignition, ventilation, and leak checks help ensure efficient operation and reduce fire, burn, and gas exposure risks.

Main parts

- Burner mixes fuel and air to produce a controlled flame.
- Burner cap and head distribute the flame around the burner.
- Control knob regulates the gas flow to the burner.
- Ignition system creates a spark on equipped models.
- Gas inlet and hose or pipe deliver fuel to the stove.
- Regulator controls gas supply pressure where applicable.
- Pan supports hold cookware above the flame.
- Drip tray or stove surface collects spills and food residue.

Before you start

1. Confirm the stove is designed for the available gas type and supply system.
2. Inspect the gas hose, regulator, connections, burner parts, and control knobs for damage.
3. Check the area for gas odour and ensure ventilation is adequate.
4. Keep flammable materials, paper, and loose cloth away from the stove.
5. Ensure burners and pan supports are correctly fitted and dry.
6. Use a suitable, stable cooking vessel and keep the cooking area clear.

How to use

1. Ensure all burner control knobs are in the off position before opening the gas supply.
2. Open the gas supply according to the appliance instructions.
3. For manual ignition, use the approved ignition method while turning the selected burner control as directed.
4. For automatic ignition, operate the control according to the manufacturer's instructions.
5. Confirm that the burner lights promptly and the flame is stable and appropriately coloured.
6. Adjust the flame to suit the cookware and cooking task.
7. Stay nearby and monitor cooking to prevent boil-over, overheating, or unattended flames.
8. Turn the burner control off after cooking and close the gas supply when required by the appliance instructions.
9. Allow the stove to cool before removing pan supports or cleaning spills.

10. Clean and dry the stove, check that all controls are off, and report any faults.

⚠ Safety

- If gas is smelled, do not ignite flames or operate electrical switches; turn off the gas if safe, ventilate, leave the area, and contact the gas supplier or emergency services.
- Never leave a lit burner unattended or use the stove to heat a room.
- Keep children and bystanders away from hot surfaces and open flames.
- Do not use a stove with a damaged hose, loose connection, or suspected gas leak.
- Never check for leaks with an open flame; use an approved method or qualified technician.
- Keep ventilation openings clear and avoid using the stove in an inadequately ventilated space.

Care & storage

- Clean burner caps and heads only after the stove has cooled and according to the manual.
- Keep burner ports clear of food residue and moisture.
- Inspect the hose, regulator, and connections at recommended intervals and replace parts as specified.
- Arrange qualified servicing for ignition problems, uneven flames, gas odour, or damaged components.

Common mistakes to avoid

- Opening the gas supply while burner controls are not in the required position.
- Using the stove despite gas odour or damaged connections.
- Leaving a burner lit without supervision.
- Cleaning or handling burner parts before they cool completely.
