Two-Wheeler

Category: **Automotive** Type: **Full SOP** Priority: **High** 3 labs

Covers these lab items: Old second hand motor cycle; Two-wheeler

What it is used for

A two-wheeler is a motorcycle or scooter used for personal or commercial transportation. Pre-ride inspection, correct starting and riding practices, routine maintenance, and protective equipment help improve vehicle reliability and reduce the risk of road injury.

Main parts

- Engine or electric motor provides propulsion.
- Fuel tank or traction battery stores the energy source.
- Throttle controls engine power or motor output.
- Brake levers or pedals operate the braking system.
- Front and rear wheels support movement and road contact.
- Tyres provide grip and absorb road irregularities.
- Headlamp, tail lamp, indicators, and reflectors improve visibility.
- Mirrors help the rider observe surrounding traffic.
- Instrument cluster displays speed, warning lights, and other vehicle information.
- Chain and sprockets or final-drive components transmit power where fitted.

Before you start

1. Only a properly licensed and competent rider should operate the two-wheeler on public roads.
2. Check vehicle registration, insurance, required emission documents, and other applicable legal requirements.
3. Inspect tyres, tread, tyre pressure, wheels, brakes, lights, indicators, mirrors, horn, and visible cables.
4. Check engine oil, coolant where applicable, fuel level, or battery charge according to the vehicle type.
5. Look for fuel, oil, coolant, or battery-fluid leaks and any loose or damaged parts.
6. Confirm that the throttle returns smoothly and both brakes operate correctly before riding.
7. Wear a correctly fitted certified helmet and suitable protective clothing and footwear; secure loose items.

How to use

1. Park the vehicle on a stable surface and follow the owner's manual for starting checks.
2. Confirm that the transmission is in neutral or the drive mode is safe for starting.
3. For an internal-combustion model, check the fuel supply and start the engine using the prescribed procedure.

4. For an electric model, confirm battery status, switch on the vehicle, and check for warning messages.
5. Allow the engine or systems to stabilise as specified by the manufacturer before moving.
6. Check the area around the vehicle, mount safely, adjust mirrors, and maintain a balanced riding position.
7. Release the stand fully and start moving gently after checking traffic and surroundings.
8. Use smooth throttle inputs, appropriate gears where fitted, and a safe speed for road and weather conditions.
9. Maintain a safe following distance and apply both brakes progressively according to road conditions and vehicle design.
10. Signal before turning or changing lanes and check mirrors and blind spots before manoeuvring.
11. Park in a permitted stable location, switch off the engine or power, and secure the vehicle against unintended movement.
12. Record defects and arrange qualified maintenance if a warning light, unusual noise, poor braking, or handling issue appears.

⚠ Safety

- Always wear a properly fastened helmet and follow applicable road traffic laws.
- Never ride under the influence of alcohol, impairing drugs, or medication that makes riding unsafe.
- Do not carry more passengers or load than the vehicle is approved to handle.
- Never use a phone or other distracting device while riding.
- Do not ride with defective brakes, unsafe tyres, steering faults, or serious warning indicators.
- Keep hands, clothing, and tools away from moving or hot parts during inspection and maintenance.

Care & storage

- Follow the owner's manual for engine oil, filters, coolant, brake fluid, and scheduled servicing as applicable.
- Maintain the correct tyre pressure and inspect tyre wear and damage regularly.
- Check brake pads or shoes, brake operation, lights, and battery condition at recommended intervals.
- Lubricate and adjust the drive chain where fitted according to the manufacturer's instructions.
- Keep the vehicle clean, dry, and protected from corrosion, and store it securely.
- Use qualified service personnel for repairs beyond the rider's competence.

Common mistakes to avoid

- Skipping tyre, brake, light, or leak checks before riding.
- Riding with an improperly fitted helmet or loose protective clothing.
- Ignoring warning lights, abnormal noises, or handling changes.
- Using incorrect fluids, incorrect tyre pressure, or unsuitable replacement parts.
