Wax Heater

Category: **Beauty, Wellness & Fitness** Type: **Full SOP** Priority: **High** 2 labs

Covers these lab items: Double Wax heater

What it is used for

A double wax heater melts two types of beauty wax in separate containers so an operator can prepare different waxing products at the same time. Use compatible wax, control each container's temperature, and follow hygiene procedures to prevent burns and contamination.

Main parts

- Heater base and two wax containers
- Independent temperature controls or thermostats
- Power switch and indicator lights
- Container lids and heat-resistant handles
- Power cord and plug
- Wax spatulas and approved application accessories

Before you start

1. Confirm that the heater is designed for the selected wax products and containers.
2. Inspect the base, containers, controls, cord, and plug for damage.
3. Place the heater on a stable, dry, heat-resistant surface.
4. Ensure both containers are clean, dry, and correctly seated in the heater.
5. Check each wax product's recommended melting temperature and fill limits.
6. Assess the client's skin condition, allergies, and suitability for waxing; prepare clean single-use applicators.

How to use

1. Switch off the heater before adding or removing wax containers.
2. Place the approved wax in the correct container without exceeding its fill limit.
3. Close the lids where applicable and connect the heater to a suitable outlet.
4. Switch on the heater and set each container's temperature independently as instructed.
5. Allow the wax to melt fully and reach a stable working temperature.
6. Check each wax temperature using the recommended safe method before application.
7. Clean and dry the treatment area according to the waxing procedure.
8. Test the wax on a suitable small area to confirm comfortable temperature and consistency.
9. Apply wax in the direction and manner recommended for the product and treatment area.
10. Use a clean applicator for each dip and never return used applicators to the wax.
11. Monitor the client's skin response and stop if burning, pain, or unusual irritation occurs.
12. Switch off and unplug the heater after use or as instructed.

3. Allow wax and containers to cool before cleaning or moving the unit.
4. Clean the containers and heater using the manufacturer's approved method.

⚠ Safety

- Only trained beauty personnel should operate the wax heater.
- Never apply wax before checking its temperature and consistency.
- Do not apply wax to broken, infected, or otherwise unsuitable skin.
- Avoid water entering molten wax or electrical components.
- Do not overfill containers or leave the heater operating unattended.
- Use single-use applicators and follow infection-control procedures to prevent cross-contamination.

Care & storage

- Switch off, unplug, and cool the heater before cleaning.
- Remove wax residue using approved products and methods only.
- Keep temperature controls, cord, and plug dry.
- Inspect containers, handles, thermostats, and electrical connections regularly.
- Arrange servicing if temperature control becomes unreliable or the unit shows damage.

Common mistakes to avoid

- Using the same container or settings without checking the requirements of each wax product.
- Applying wax that is too hot or not fully melted.
- Double-dipping a used applicator and contaminating the wax.
- Cleaning or moving the heater while it is hot or connected to power.
