Bashpa Swedan

Category: **Beauty, Wellness & Fitness** Type: **Full SOP** Priority: **High** 1 labs

Covers these lab items: Bashpa Swedan

What it is used for

Bashpa Swedan is a steam-based wellness procedure used in traditional practices to expose the body to controlled warmth and steam. Perform it only with appropriate training, suitable equipment, informed consent, and health screening, while carefully controlling temperature, duration, hydration, and emergency access.

Main parts

- Steam generator or heating unit
- Treatment chamber, enclosure, or steam tent
- Steam delivery pipe and outlet
- Temperature control and thermometer
- Timer and ventilation arrangement
- Water reservoir, drain, and emergency shutoff

Before you start

1. Confirm the person's consent, treatment purpose, and suitability for the procedure through the applicable health screening process.
2. Do not proceed if the person has a condition or symptom for which heat or steam exposure is contraindicated; seek qualified clinical advice when uncertain.
3. Inspect the steam generator, pipes, chamber, controls, electrical connections, and emergency shutoff for damage or leaks.
4. Check that the treatment area is clean, ventilated, and equipped with safe access and a quick way to stop steam delivery.
5. Verify that temperature and timer controls work correctly and that water is at the required level.
6. Explain the procedure, expected warmth, possible discomfort, stop signal, and the need to report dizziness, nausea, breathing difficulty, or excessive heat.

How to use

1. Prepare the equipment and treatment area according to the manufacturer's instructions and facility protocol.
2. Fill the reservoir with the specified water and confirm that the drain and steam outlet are clear.
3. Start the steam generator and allow the chamber to reach the approved treatment conditions before the person enters.
4. Verify the actual temperature using the designated measuring device; do not rely only on a control setting.

5. Help the person enter or position themselves safely, keeping the face and airway clear of direct steam jets.
6. Set the treatment duration and temperature within the approved protocol and the person's tolerance.
7. Stay nearby and monitor comfort, skin response, breathing, and general condition throughout the procedure.
8. Stop steam delivery immediately if the person reports excessive heat, dizziness, nausea, weakness, pain, or breathing difficulty.
9. Assist the person out safely, allow gradual cooling, and provide drinking water if appropriate and permitted.
10. Switch off the steam generator and isolate power before draining or cleaning the equipment.
11. Clean and disinfect contact surfaces and reusable accessories according to the facility protocol.
12. Record the treatment duration, settings, person's response, and any adverse event; report concerns to the responsible practitioner.

⚠ Safety

- Only trained and authorised personnel should perform or supervise the procedure.
- Avoid steam exposure that could cause burns; never direct hot steam onto the face or sensitive skin.
- Do not leave the person unattended during treatment, especially if mobility or heat tolerance is limited.
- Stop immediately if faintness, confusion, chest discomfort, breathing difficulty, or signs of heat illness occur; seek emergency assistance when indicated.
- Use extra caution with children, older adults, pregnancy, impaired sensation, cardiovascular conditions, and other heat-sensitive circumstances; obtain qualified medical advice where appropriate.
- Do not open pressurised steam lines or service the heater while hot or connected to power.

Care & storage

- Drain and clean the water reservoir according to the manufacturer's instructions and facility hygiene protocol.
- Remove mineral deposits using an approved descaling method at the specified interval.
- Inspect steam hoses, seals, controls, temperature sensors, and electrical connections regularly.
- Keep the treatment chamber dry and ventilated between uses.
- Remove damaged equipment from service and arrange qualified inspection or repair.

Common mistakes to avoid

- Using excessive temperature or treatment duration without following an approved protocol.
- Leaving the person unattended or ignoring early signs of heat intolerance.
- Allowing direct steam contact to burn the skin.
- Cleaning or opening hot equipment before it has cooled and been isolated.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the

manufacturer's original manual / file.
