Fumigation Probe

Category: **Agriculture & Gardening** Type: **Short SOP** Priority: **High** 3 labs

Covers these lab items: Metal Probe; Metal Probe (12 ft long for introducing ALP tablets)

What it is used for

A fumigation probe is used to introduce approved fumigant tablets into designated grain or storage locations when permitted by the applicable procedure. Because aluminium phosphide can release highly toxic phosphine gas, use this equipment only through authorised, trained fumigation personnel.

How to use

1. Verify that the fumigation task is legally authorised and covered by an approved site procedure.
2. Inspect the probe for damage, blockage, or loose parts before use.
3. Confirm the target material, treatment location, and required equipment using the approved fumigation plan.
4. Wear the specified protective equipment and establish the required exclusion zone and warning signs.
5. Use the probe only as directed by the authorised fumigation procedure and product label.
6. Keep untrained people and animals away from the treatment area.
7. After the operation, secure the area and follow the prescribed monitoring and clearance procedure.
8. Clean, inspect, and store the probe only as directed by the authorised procedure.

⚠ Safety

- Never handle aluminium phosphide tablets or perform fumigation without required training and legal authorisation.
- Phosphine gas is highly toxic; never rely on smell to detect its presence.
- Never enter a treated or suspected contaminated area without authorised clearance and required respiratory protection.
- Follow the product label, safety data sheet, emergency plan, and local regulations.

Care & storage

- Inspect the probe after use and report damage or blockage before reuse.
- Store the probe in its designated secure area under the site's fumigation procedures.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
