# Birthing Simulator

Category: **Medical, Healthcare & First Aid** Type: **Full SOP** Priority: **Medium** 1 labs

**Covers these lab items:** Birthing Simulator

## What it is used for

A birthing simulator provides practical training for normal childbirth, delivery assistance, and selected obstetric emergency scenarios. It allows learners to practise approved techniques on a model under supervision without involving a real patient.

## Main parts

- Maternal pelvis and torso model
- Birth canal and replaceable vaginal insert
- Fetal mannequin with cord and placenta model if supplied
- Positioning supports and assembly connectors
- Lubricant and compatible training accessories
- Cleaning supplies and replacement components

## Before you start

1. Read the simulator instructions and confirm which birth and emergency scenarios the model supports.
2. Inspect the torso, pelvis, birth canal, fetal model, cord, and connectors for damage.
3. Assemble the simulator securely according to the manufacturer's instructions.
4. Prepare only the approved lubricants and training accessories for the planned exercise.
5. Clean the model and accessories using the required infection-control procedure.
6. Explain the training objectives, supervision requirements, and limits of the simulator to participants.

## How to use

1. Position the simulator securely on the designated training table or support.
2. Assemble the maternal and fetal components according to the selected scenario.
3. Demonstrate the approved assessment and preparation steps for the simulated birth.
4. Apply compatible training lubricant as specified to reduce friction on replaceable components.
5. Guide the fetal model through the birth canal using the supervised technique for the scenario.
6. Practise supporting the simulated delivery and handling the cord or placenta model only as instructed.
7. For emergency scenarios, follow the approved training protocol and instructor guidance.
8. Stop if components become stuck, misaligned, or subject to excessive force.
9. After the exercise, disassemble the reusable components according to the instructions.
10. Clean, dry, inspect, and reset the simulator for the next session.

## ⚠ Safety

- Use the simulator only for training procedures approved by the manufacturer.
- Do not use excessive pulling, twisting, or pressure on the fetal model or birth canal.
- Do not use unapproved oils or lubricants that may damage the model material.
- Follow infection-control requirements when components are shared between learners.
- Use sharp instruments only if the model and supervised training procedure explicitly allow them.
- Explain that real childbirth and obstetric emergencies require qualified clinical care and local emergency protocols.

## Care & storage

- Clean and disinfect reusable surfaces and inserts after each session using compatible products.
- Inspect the birth canal, fetal model, cord, connectors, and supports for wear or tears.
- Replace damaged or worn components with manufacturer-approved parts.
- Store the simulator clean, dry, and assembled or disassembled as recommended.

## Common mistakes to avoid

- Incorrect assembly can interfere with the simulated delivery and damage the components.
- Using incompatible lubricant can degrade the birth canal material.
- Pulling the fetal model with excessive force can tear inserts or connectors.
- Treating simulation practice as a substitute for supervised clinical training can create unsafe expectations.

*Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.*
