Microcontroller Board

Category: **Electrical & Electronic Components & Kits** Type: **Short SOP** Priority: **Medium**

15 labs

Covers these lab items: Ardino Uno Micro Controller; Arduino; Arduino Boards (UNO/Nano); Arduino UNO; Arduino Yún; ESP32; LightBlue Bean Punch Through; Microcontroller; Microduino; Microprocessor boards; OpenPicus; Pinoccio; Processors, controllers, sensors and communication hardware; SODAQ

What it is used for

Use the microcontroller board to read inputs, process data, and control electronic devices through programmed instructions.

How to use

1. Inspect the board, USB port, pins, and components for visible damage.
2. Install the correct development software and select the matching board model.
3. Connect the board to the computer using a suitable USB cable.
4. Write or open a compatible program and verify the selected port.
5. Upload the program and observe the board indicators and connected device response.
6. Disconnect power before changing wiring or attaching external components.

⚠ Safety

- Use the correct voltage and polarity for the board and connected components.
- Avoid short circuits between power, ground, and signal pins.
- Disconnect power before changing circuit connections.
- Use suitable drivers and trusted code when connecting external devices.

Care & storage

- Keep the board dry, clean, and protected from static electricity.
- Store it in an antistatic bag or suitable case.
- Avoid bending pins or applying force to connectors.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
