Suspension System

Category: **Automotive** Type: **Short SOP** Priority: **Medium** 2 labs

Covers these lab items: Suspension Steering Wheel and Tyre Systems; Suspension system

What it is used for

A suspension system supports the vehicle body and helps absorb road shocks while maintaining tyre contact. Use training models or inspect actual vehicle components only under authorized supervision.

How to use

1. Park the vehicle on level ground, apply the parking brake, and switch off the engine.
2. Identify suspension components using the training model or approved service information.
3. Check visible springs, shock absorbers, linkages, and mounts for damage or leakage.
4. Observe steering and tyre movement only under an instructor's approved procedure.
5. Use specified tools and lifting equipment if any practical inspection requires vehicle access.
6. Report defects and restore all guards and components before returning equipment to service.

⚠ Safety

- Never work beneath a vehicle supported only by a jack.
- Do not dismantle loaded springs or pressurized suspension components without specialist training.
- Keep hands away from moving steering linkages and pinch points.
- Only trained and authorized personnel should lift or repair actual vehicles.

Care & storage

- Keep training models clean, report loose parts, and follow the vehicle maintenance schedule.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
