Telemetry Module

Category: **Drones & Aviation** Type: **Short SOP** Priority: **Medium** 2 labs

Covers these lab items: 433 MHz Telemetry

What it is used for

A telemetry module transmits data between compatible equipment, such as a drone and its ground station. Use the approved frequency, configuration, and operating procedure for the training system.

How to use

1. Inspect the module, antenna, connectors, cables, and mounting for damage.
2. Confirm that the module is compatible with the controller and ground station.
3. Check the approved frequency, configuration, and local operating requirements with the instructor.
4. Power off equipment before connecting the module and antenna.
5. Secure the antenna and mount the module as specified by the manufacturer.
6. Power on the system and verify the link and data readings before operation.
7. Power down the system before disconnecting or storing the module.

⚠ Safety

- Never transmit without a suitable antenna connected when the equipment requires one.
- Keep antennas away from eyes and avoid touching exposed electrical contacts.
- Use radio equipment only on authorized frequencies and within applicable local rules.
- Do not change flight-control or telemetry settings without instructor approval.

Care & storage

- Keep connectors clean and dry and store the module in an anti-static protective case.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
