Condenser

Category: **Laboratory Instruments & Glassware** Type: **Short SOP** Priority: **Medium**

1 labs

Covers these lab items: Condenser

What it is used for

A laboratory condenser cools vapour and converts it into liquid during suitable experimental procedures. Use the correct condenser type and maintain controlled coolant flow.

How to use

1. Identify the condenser type and check the glass body and joints for cracks.
2. Secure the condenser vertically or in the required position using suitable clamps.
3. Connect coolant hoses to the designated inlet and outlet ports.
4. Check hose connections and start a gentle, steady coolant flow.
5. Begin the approved experiment and monitor the coolant flow and apparatus.
6. Stop heating before shutting down the coolant, following the procedure.
7. Allow the apparatus to cool, then disconnect hoses and clean as instructed.

⚠ Safety

- Wear goggles and suitable PPE when working with glassware and hot liquids.
- Do not use cracked glassware or force tight glass joints.
- Secure hoses to prevent leaks and keep water away from electrical equipment.
- Never seal an apparatus unless the experiment specifically requires a rated closed system.

Care & storage

- Rinse and dry the condenser as directed and store it in a padded glassware rack.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
