Infrared Camera

Category: **Audio-Visual, Camera & Media** Type: **Short SOP** Priority: **Medium** 1 labs

Covers these lab items: Infrared Ray based Camera

What it is used for

An infrared camera detects infrared radiation to display thermal patterns or capture images in supported infrared bands. Configure the camera correctly and interpret readings according to its intended application.

How to use

1. Inspect the camera, lens, battery, display, and connectors for damage.
2. Charge or install the approved battery and switch on the camera.
3. Select the correct imaging mode, temperature range, and measurement settings for the task.
4. Focus the lens and position the camera at a suitable distance from the target.
5. Capture the image while keeping the camera steady and following the operating instructions.
6. Review the image and record relevant settings and observations.
7. Switch off the camera, protect the lens, and store the equipment safely.

⚠ Safety

- Do not point the camera directly at the sun unless it is specifically rated for that use.
- Follow laser safety precautions if the device includes a laser pointer.
- Do not touch hot targets or enter hazardous areas just to obtain an image.
- Remember that thermal readings depend on emissivity, distance, and environmental conditions.

Care & storage

- Clean the lens with approved materials and protect the camera from moisture, dust, and impact.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
