Irrigation System

Category: **Agriculture & Gardening** Type: **Short SOP** Priority: **Medium** 1 labs

Covers these lab items: Irrigation system

What it is used for

An irrigation system supplies water to crops through suitable channels, pipes, sprinklers, or drip lines. Operate it according to crop water needs and the system's design specifications.

How to use

1. Inspect the water source, pump, filters, valves, pipes, and emitters for damage or leaks.
2. Confirm the water supply is suitable and available for irrigation.
3. Open the required valves and start the pump according to the operating procedure.
4. Check water pressure and flow at the designated points.
5. Apply water evenly according to crop requirements and the irrigation schedule.
6. Inspect the field for blocked emitters, leaks, pooling, or uneven distribution.
7. Stop the system, close valves as directed, and record any maintenance needs.

⚠ Safety

- Keep electrical pumps and connections protected from water exposure.
- Do not operate pumps without adequate water supply if dry running can cause damage.
- Relieve pressure before opening pressurized lines or filters.
- Use approved precautions when working near ponds, channels, or other water hazards.

Care & storage

- Clean filters and emitters regularly and repair leaks before the next irrigation cycle.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
