Signal Detector

Category: **Electrical & Electronic Test Instruments** Type: **Short SOP** Priority: **Medium**

1 labs

Covers these lab items: Signal detector

What it is used for

A signal detector identifies or indicates the presence of specified electrical, radio-frequency, or other signals depending on its design. Verify the detector's operating range and intended use before testing.

How to use

1. Inspect the detector, probe, antenna, display, battery, and leads for damage.
2. Read the manual to confirm the signal type, detection range, and operating limits.
3. Select the correct mode and sensitivity for the signal being checked.
4. Connect probes or position the antenna as specified by the manufacturer.
5. Power on the detector and perform any required self-test or calibration.
6. Scan the intended area or circuit and observe the displayed indication.
7. Record relevant results, switch off the device, and disconnect accessories after use.

⚠ Safety

- Do not use the detector as proof of electrical isolation unless specifically rated and approved for that purpose.
- Keep probes and hands away from exposed live conductors.
- Use only the specified accessories and operating range.
- Follow site authorization and applicable radio-frequency restrictions.

Care & storage

- Clean the detector with an approved method and store it with probes protected.

Disclaimer: This SOP is prepared from general information available on the internet. For detailed instructions, refer to the manufacturer's original manual / file.
